Drayage Quote SOP

Owner: Jericho Freight	**Effective Date: 08/25/26**
Version: 1.0	**Department: Brokerage**

General Information

Description / Objective	Teach any teammate how to quote a short container move from a port or rail yard, how chassis and accessorials add up, and how to print a DRAY-Q file the customer can understand.
Assignee	Santiago Rendon

1. What drayage is

1.1 Kid picture

A ship or a train brings a big metal box (a container) to a yard. Drayage is the short truck ride that takes that box to a warehouse, or back to the yard. It is not a cross-country van load. It is the last (or first) little hop.

The truck often does not own the metal frame under the box. That frame is a chassis, like training wheels that the box sits on. We usually rent it by the day, with a 2-day minimum in this app.

2. How to open it

2.1 Click path

Home screen, click Dray. Header should say Drayage Quote Builder. Origin terminal is required. Generate will refuse without one.

3. Customer and previous dray quotes

3.1 Memory

Include customer on quote works like other modes. Load Previous Quote only lists dray snapshots labeled DRAY-Q plus the number. Multiple warehouse stops are remembered as repeating facility boxes.

4. Direction, container, and steamship line

4.1 The story of the box

Import means the box is full coming out of the terminal toward the warehouse, then usually empty going back. The PDF labels that Full OUT and Empty IN.

Export means the truck often picks empty, loads at the shipper, and returns full. Labels flip to Empty PU and Full IN.

Container is the box size, like 40' ST (standard 40-foot). 20' is shorter. HC is high cube (taller). RF is reefer. Pick what is really on the booking.

SSL is the steamship line (Maersk, MSC, and so on). No Info is allowed if you do not know yet. Knowing it helps operations, not the dollar math.

5. Origin terminal, return terminal, and facilities

5.1 Where the truck goes

Origin terminal is the port or rail yard. Search your local terminal list. You can add a new terminal under Settings, Terminal Locations.

Return terminal can be the same yard or a different one. If blank, the app reuses origin.

Facilities are warehouses. You may add more than one. Name, address, city, state, ZIP. Import calls them receivers. Export calls them shippers. Extra stops usually need the Stop-off accessorial.

6. Miles, prepull warning, and why miles stay off the PDF

6.1 Miles are for you, not the letter

The form can measure truck miles from origin ZIP through each facility ZIP back to return ZIP. If the first leg is 150 miles or more, the app suggests prepull. Prepull means 'get the box yesterday and park it, because you cannot pull and deliver the same day.'

The printed quote does not show miles. Customers in this product buy a linehaul plus extras, not a mileage invoice. Do not write miles on the PDF by hand unless the customer asked.

7. Linehaul and fuel math

7.1 The two big dollars

Linehaul is the main dray price you type. If you leave it blank, the app can fall back to older turn-economics fields (loaded miles, empty miles, rpm). Most teammates should just type the linehaul they agreed with the carrier.

Fuel can be a dollar amount or a percent of linehaul. Percent mode: fuel = linehaul x percent / 100. Amount mode: fuel is the dollars you typed.

The printed fuel line looks like FSC (20% thru 08/31/26). The percent is computed even if you typed dollars, so the customer sees the equivalent percent through the valid-until date.

Fuel

If fsc_mode is percent: fsc = linehaul x fsc_value / 100

If fsc_mode is amount: fsc = the dollars you typed

Tiny example: linehaul $450, fuel 20%. FSC = $90. Printed line: FSC (20% thru the valid date).

8. Chassis math

8.1 Renting the frame

Chassis days is how many days you will keep the frame. The app will not go below 2 days.

Standard chassis is $50 per day. If overweight is on, or triaxle is on, the rate becomes $100 per day (triaxle).

Chassis rental = rate x days.

Chassis split is $150 each time you must swap frames (common at some rail ramps). You may pick 0, 1, or 2 splits. Split money = 150 x count.

Chassis subtotal = rental + splits. This always sits in the pricing column even if accessorials are zero.

Chassis

rate = $100/day if overweight or triaxle, else $50/day

days = max(days you typed, 2)

rental = rate x days

splits = $150 x split count (0 to 2)

Tiny example: 2 standard days + 1 split = $100 + $150 = $250 chassis package. Overweight 2 days with no split = $200.

9. Accessorial checklist and fees

9.1 Fixed extras in this app

These amounts are built in. Checking the box adds that fee. Unchecked adds nothing.

Reefer $150. Hazmat $150. Overweight (OW) $150. Layover $300. Stop-off $125. Pre-Pull $150. Residential $100.

Overweight also flips chassis to triaxle rate. The 44,000 lb hint is a warning. You still must check the overweight box for the $150 OW fee and the $100/day chassis.

Tolls and Other are free-typed dollars.

Quoted total = linehaul + fuel + all accessorial lines + chassis subtotal.

Grand total

quoted total = linehaul + fsc + accessorials + chassis rental + chassis splits

Tiny example: $450 linehaul + $90 FSC + $150 reefer + $100 chassis (2 days x $50) = $790. Add a $150 split and it becomes $940.

10. Live totals

10.1 The floating box

While you click checkboxes, a live total updates. Trust it as a preview. Generate uses the same rules. If live total and PDF disagree, you changed a field after looking. Generate again.

11. Generate and DRAY-Q file name

11.1 Print

Generate Quote. If origin terminal is empty, you get an error and no number is burned. Print Quote names the file DRAY-Q plus the number. Old files named only Q4242 were the previous style. Use DRAY-Q now.

Default validity is 7 days if you left Valid Until blank.

12. Output fields and customer value

12.1 Walk the PDF

Quote Details: direction, container, SSL, terminals with Full OUT / Empty IN labels, warehouse names and cities. This is the movie of the box.

Pricing Details: linehaul, FSC line with percent and thru date, chassis line with type and days, then the total. Customers in dray care that chassis is not a surprise.

Accessorials section lists each extra. If there are none, that block is quiet. Still say 'no extras in this number' out loud.

Overweight and hazmat flags on the details side warn operations, not just accounting.

13. What to say out loud

13.1 Simple pitch

You can say: 'This is the truck piece from the terminal to your warehouse and back. The total includes fuel and chassis for two days. If the box sits longer, chassis days go up. Prepull, extra stops, and overweight are separate lines so you can see them.'

14. Common mistakes

14.1 Watch-outs

Generating without an origin terminal.

Leaving chassis at 2 days when the customer will keep the box a week.

Checking overweight weight in pounds but forgetting the overweight checkbox.

Import vs export labels backwards. The customer will think we are pulling the wrong way.

Loading an FTL previous quote. You cannot. Use the dray picker.

Definitions	
Drayage	Short container trucking between a port or rail yard and a nearby warehouse.
Chassis	The wheeled frame under a container. Rented by the day in this quote.
SSL	Steamship line. The ocean carrier that owns or operates the box.
Prepull	Pulling the box early and parking it because same-day pull and deliver will not work.
Chassis split	Swapping chassis, often at a rail ramp. $150 each in this app.

Triaxle	A heavier chassis. $100/day here, used with overweight.
DRAY-Q	Print file prefix for this mode.
